CERTIFICATE

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried outby **Sufiyan Desai (1BM22CS351)** who is Bonafide student of **B.M.S. College of Engineering.** It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

Swathi Sridharan Professor Department of CSE, BMSCE	Dr. Jyothi S Nayak Professor & HOD Department of CSE, BMSCE

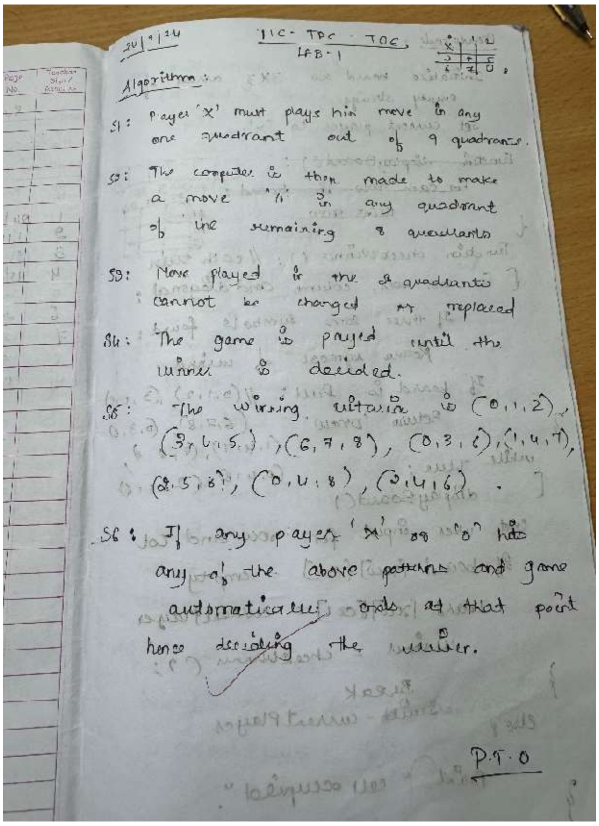
Program 1

Implement Tic –Tac –Toe Game
Implement vacuum cleaner agent
Tic-Tac-Toe



24/9/24

TIC - TAC - TOE
LAB - 1

Algorithm :

S1 : Player 'X' must plays his move in any one quadrant out of 9 quadrants.

S2 : The computer is then made to make a move 'O' in any quadrant of the remaining 8 quadrants

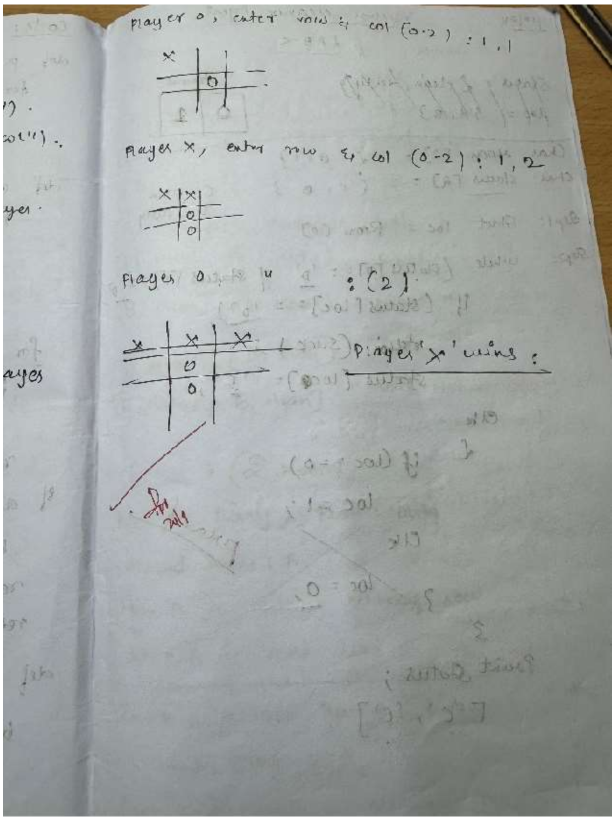
S3 : Move played in the quadrants cannot be changed or replaced

S4 : The game is played until the winner is decided.

S5 : The winning criteria is (0,1,2), (3,4,5), (6,7,8), (0,3,6), (1,4,7), (2,5,8), (0,4,8), (2,4,6).

S6 : If any player 'X' or 'O' hits any of the above patterns and game automatically ends at that point hence deciding the winner.

P.T.O



Player O, enter row & col (0-2) : 1, 1

Player X, enter row & col (0-2) : 1, 2

Player O ... : (2)

Player 'X' wins :

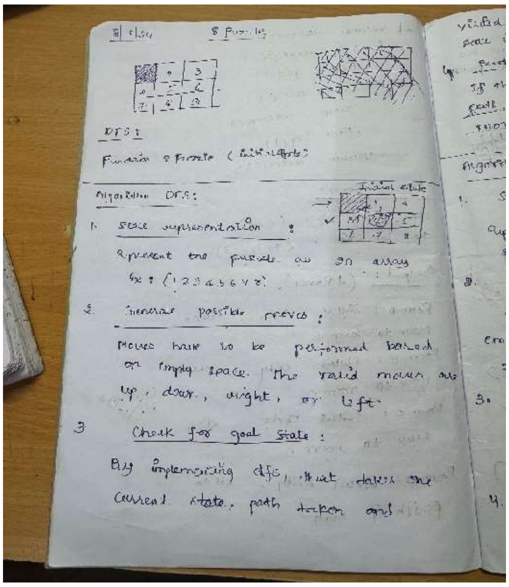
Program 2
Implement 8 puzzle problems using Depth First Search (DFS)
Implement Iterative deepening search algorithm

8 puzzle using DFS
Algorithm:



8 Puzzle

DFS:

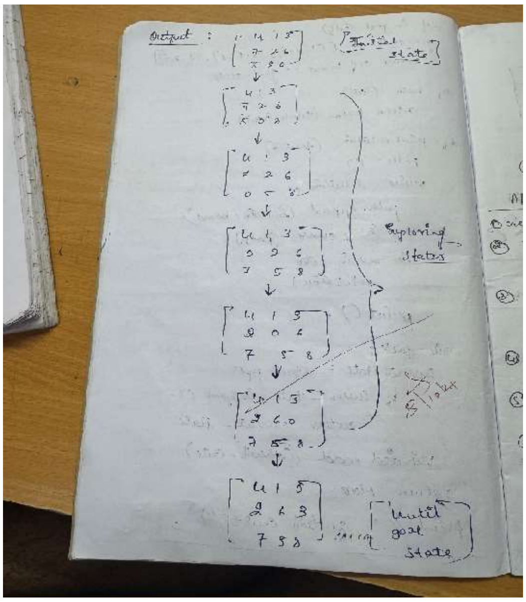
Algorithm DFS:

Initial state

1. State representation:
Represent the puzzle as an array
Ex: (1 2 3 4 5 6 7 8)

2. Generate possible moves:
Moves have to be performed based on empty space. The valid moves are up, down, right, or left.

3. Check for goal state:
By implementing dfs, that takes the current state, path taken and



Output:

Initial state

Exploring states

until goal state

Code:

```
def dfs(initial_board, zero_pos):
    stack = [(initial_board, zero_pos, [])]
    visited = set()

    while stack:
        current_board, zero_pos, moves = stack.pop()

        if is_goal(current_board):
            return moves, len(moves) # Return moves and their count

        visited.add(tuple(current_board))

        for neighbor_board, neighbor_pos in get_neighbors(current_board, zero_pos):
            if tuple(neighbor_board) not in visited:
                stack.append((neighbor_board, neighbor_pos, moves + [neighbor_board]))
```

```
    return None, 0 # No solution found, return count as 0

# Initial state of the puzzle
initial_board = [1, 2, 3, 0, 4, 6, 7, 5, 8]
zero_position = (1, 0) # Position of the empty tile (0)

# Solve the puzzle using DFS
solution, move_count = dfs(initial_board, zero_position)

if solution:
    print("Solution found with moves ({} moves):".format(move_count))
    for move in solution:
        print_board(move)
        print() # Print an empty line between moves
else:
    print("No solution found.")
```

```

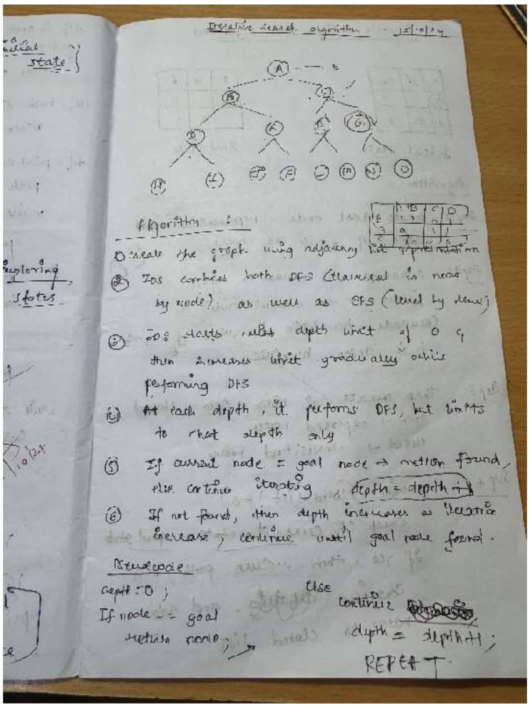
[4, 5, 6]
[7, 8, 0]
```

Implement Iterative deepening search algorithm:

Algorithm:



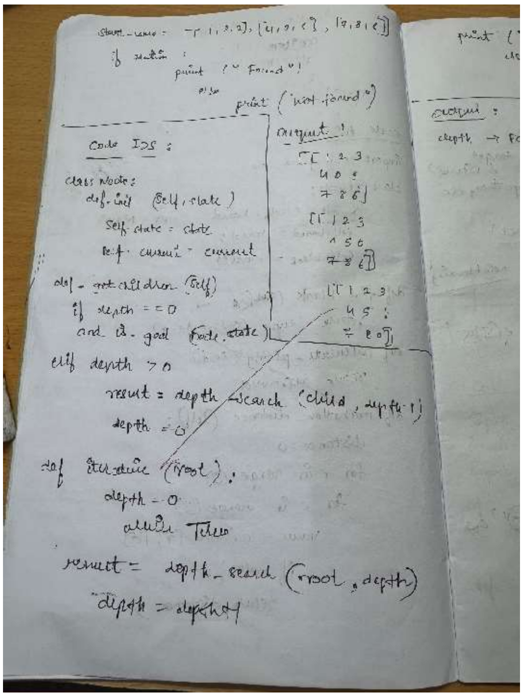
Iterative search algorithm 15/10/24

Algorithm :

1. Create the graph using adjacency list representation
2. IDS combines both DFS (traversal is node by node) as well as BFS (level by level)
3. IDS starts with depth limit of 0 & then increases limit gradually while performing DFS
4. At each depth, it performs DFS, but limits to that depth only
5. If current node = goal node → return found, else continue iterating, depth = depth + 1
6. If not found, then depth increases as iteration increase, continue until goal node found.

Pseudocode

```
depth = 0 ;
If node == goal
    return node ;
else
    continue
    depth = depth+1 ;
REPEAT.
```



```
start_state = [[1, 2, 3], [4, 0, 6], [7, 8, 6]]
if solution :
    print ("Found")
else
    print ("not found")
```

Code IDS :

```
class Node:
    def_init (self, state)
        self.state = state
        self.current = current
def_get children (self)
    if depth == 0
    and is_goal (node.state)
elif depth > 0
        result = depth_search (child, depth-1)
        depth = 0
def iterative (root):
        depth = 0
        while True
    result = depth_search (root, depth)
    depth = depth+1
```

Output :

```
[[1 2 3
  4 0 5
  7 8 6]
[[1 2 3
  4 5 6
  7 8 6]]
[[1 2 3
  4 5 :
  7 8 0]]
```

Code:

```
from collections import deque

class PuzzleState:
    def __init_(self, board, zero_pos, moves=0, previous=None):
        self.board = board
        self.zero_pos = zero_pos # Position of the zero tile

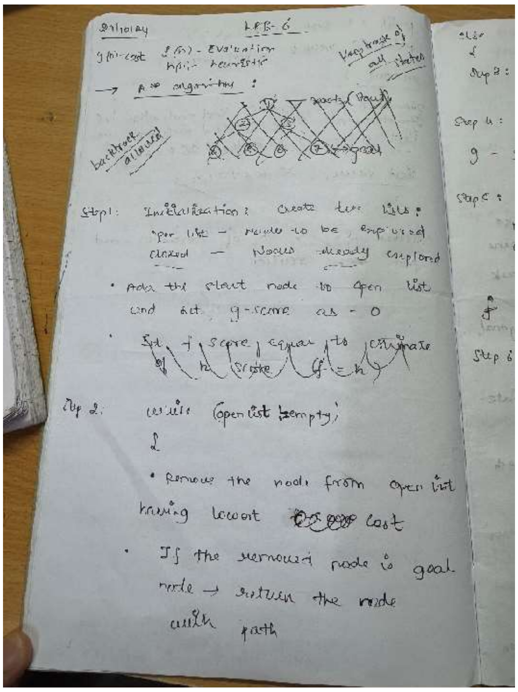
Program 3

Implement A* search algorithm

Algorithm:



21/10/24 LAB-6

g(n) - cost f(n) - Evaluation
h(n) - heuristic

Keep track of all states

→ A* algorithm :

backtrack allowed

goal

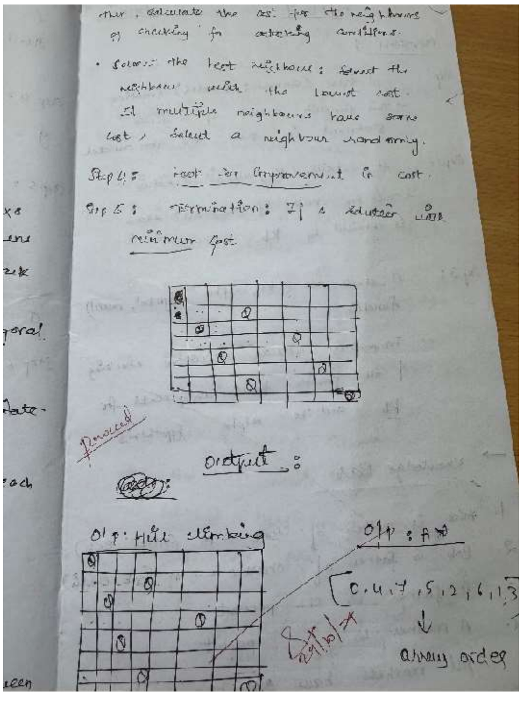
Step 1: Initialization : Create two lists :
open list – nodes to be explored
closed – Nodes already explored

• Add the start node to open list and set g-score as - 0

• Set f score equal to estimate of h score (f = h)

Step 2: while (open list empty)
{
• Remove the node from open list having lowest cost

• If the removed node is goal node → return the node with path



then, calculate the cost for the neighbours by checking for attacking conditions.

• Select the best neighbour : Select the neighbour with the lowest cost. If multiple neighbours have same cost, select a neighbour randomly.

Step 4 : Look for improvement in cost.

Step 5 : Termination : If a solution with minimum cost.

Output :

O/P: Hill climbing

O/P : A*

[0, 4, 7, 5, 2, 6, 1, 3]

```

```
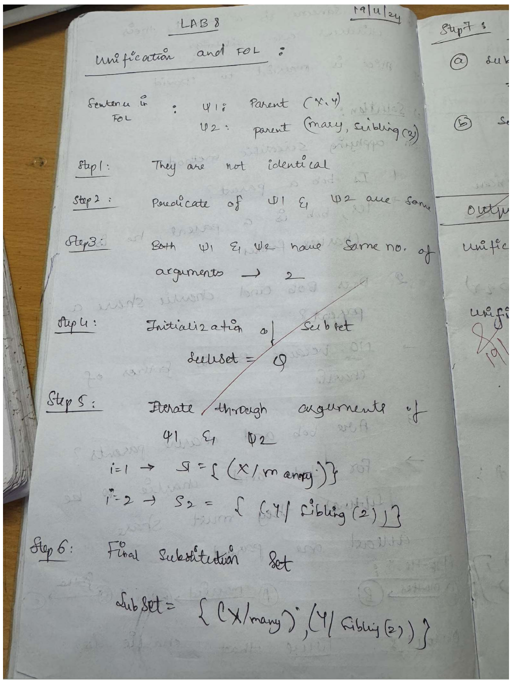
The best position found is: [0 8 5 2 6 3 7 4]
The number of queens that are not attacking each other is: 8
```

Program 6
Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.

Algorithm:



LAB 8 19/11/24

Unification and FOL :

Sentence in FOL : Ψ1 : Parent (X, Y)
Ψ2 : parent (mary, sibling(z))

Step 1 : They are not identical

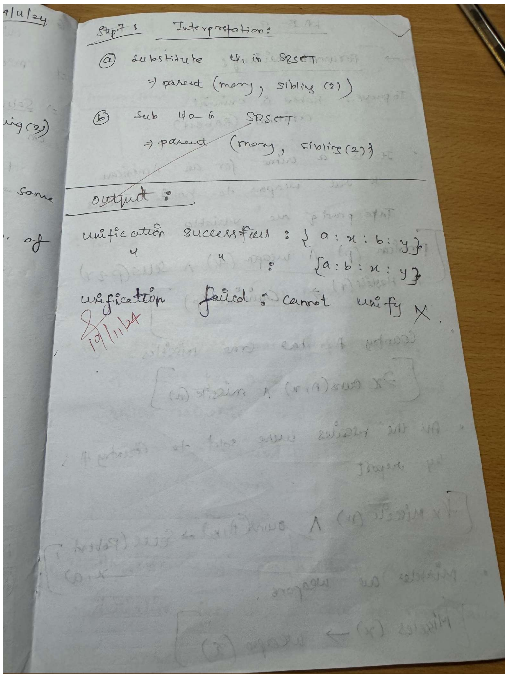
Step 2 : Predicate of Ψ1 & Ψ2 are same

Step 3 : Both Ψ1 & Ψ2 have same no. of arguments → 2

Step 4 : Initialization of subset
subset = φ

Step 5 : Iterate through arguments of Ψ1 & Ψ2
i=1 → S1 = {(X/mary)}
i=2 → S2 = {(Y/ sibling (z))}

Step 6 : Final substitution set
Sub set = {(X/mary), (Y/ sibling(z))}



Step 7 : Interpretation:

(a) substitute Ψ1 in SBSET
⇒ parent (mary, sibling (z))

(b) Sub Ψ2 in SBSET
⇒ parent (mary, sibling(z))

Output :

unification successful : {a : x : b : y}
" " : {a : b : x : y}
unification failed : cannot unify X.

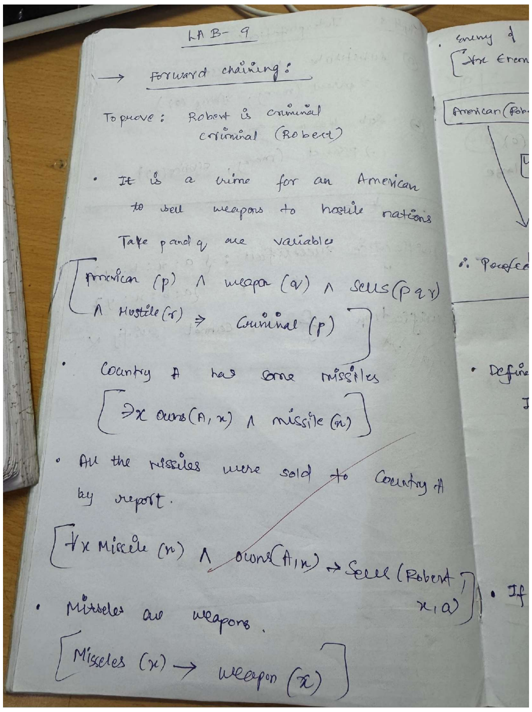
Program 8
Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

Algorithm:



LAB- 9

→ Forward chaining:

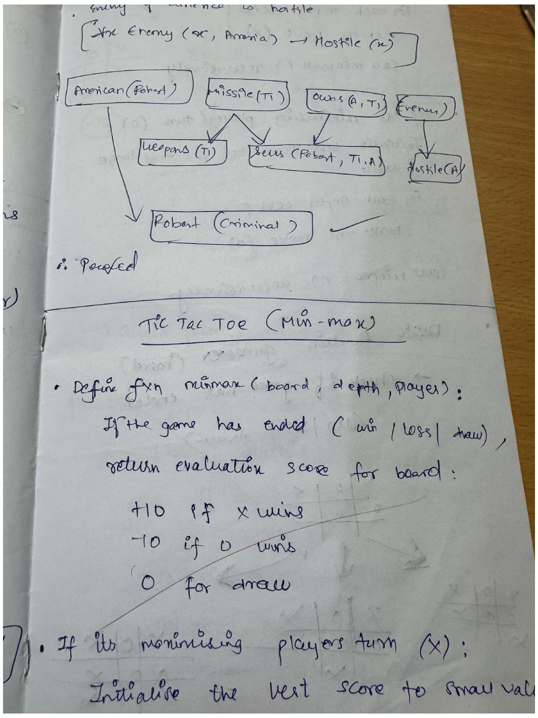
To prove: Robert is criminal
criminal (Robert)

- It is a crime for an American to sell weapons to hostile nations
Take p and q are variables
[American (p) ∧ weapon (q) ∧ sells(p q r) ∧ Hostile (r) ⇒ Criminal (p)]

- Country A has some missiles
[∃x owns(A, x) ∧ missile (x)]

- All the missiles were sold to Country A by report.
[∀x Missile (x) ∧ owns(A, x) → Sell (Robert, x, a)]

- Missiles are weapons.
[Missiles (x) → weapon (x)]



Enemy of America is hostile
[∀x Enemy (x, America) → Hostile (x)]

American(Robert) Missile(T1) Owns (A, T1) Enemy
Weapons (T1) Sells (Robert, T1, A) Hostile(A)
Robert (Criminal)

∴ Proved

Tic Tac Toe (Min-max)

- Define fxn minimax (board, depth, player):
If the game has ended (win / loss / draw),
return evaluation score for board:
+10 if x wins
-10 if o wins
0 for draw

- If its maximising players turn (X):
Initialise the best score to small val

Code:

```
# Define the knowledge base (KB) as a set of facts
KB = set()

# Premises based on the provided FOL problem
KB.add('American(Robert)')
KB.add('Enemy(America, A)')
KB.add('Missile(T1)')
KB.add('Owns(A, T1)')

# Define inference rules
def modus_ponens(fact1, fact2, conclusion):
    """ Apply modus ponens inference rule: if fact1 and fact2 are true, then conclude conclusion """
    if fact1 in KB and fact2 in KB:
